Large avalanche near Texas meadows

Came across a relatively large wet avalanche when approaching Texas meadows from Bradley's meadows. Elevation around 7600ft, aspect, SSE. Depth: to ground.

Considering the new snow on top of the debris, I'm guessing this slid prior to the storm last week. The slide path was melted out to dirt. Out of curiosity, we dug just to the lookers right of the slide and found soft snow near the ground - still evidence of crystal structure but could make a snowball if squeezed. Best guess is that a point release wet slide entrained enough snow to step down and release the whole face.

Region
Bridger Range
Location (from list)
Texas Meadow
Observer Name
Amanda Kautzer
