Natural avalanche on Fan Mountain

Date Sat, 02/25/2023 - 13:30

From email 2/25/23: "... a good sized <u>slab</u> avalanche on Fan, NE Face. Crown height hard to estimate but looked like a 2' or so. Maybe running on interface from when it got cold earlier in the week? Possibly deeper than that but sure could have loaded that much this week. Anyway- very white <u>bed surface</u>, good <u>propagation</u>, 200' -300' crown length, debris stopped on upper bench. D2.5. Likely triggered by cornice fall."

Region Northern Madison Location (from list) Fan Mountain Observer Name Mike Buotte
