

"Today (Saturday, 4/19), I triggered a small soft-slab avalanche at about 7,700' on a E-NE aspect on the headwall between Frazier Lake and Angier Lake in the northern Bridgers. The slide was maybe 6" deep, 20' wide and ran 100-200 feet and involved only the new storm snow over the icy, thick crust underneath. No one was caught or injured, though I had a bit of a scare because my dog was right in the path (luckily she outran it)."

Advisory Region Bridger Range Longitude -110.98W Latitude 45.92N **Avalanche Details:** <u>Skier-triggered small soft slab, northern Bridger Range</u> **Forecast link:** <u>GNFAC Avalanche Forecast for Mon Apr 21, 2025</u> Bridger Range, 2025-04-20
