## Skier triggered small wind slab on Saddle Peak

Saddle Peak
Bridger Range
12/23/2021
Code
HS-ASc-R1-D1-I
Elevation
9000
Aspect
E
Latitude
45.79430
Longitude
-110.93600

Notes

Slab Thickness 7.0 inches Vertical Fall

Slab Width 10.00ft

Weak Layer Grain type

70ft

We were able to intentionally <u>trigger</u> this 6-8" deep <u>wind slab</u> on Saddle Peak on December 23, 2021, E <u>aspect</u> at 9,000'. It showed us that recently formed wind slabs were still reactive. This hard <u>slab</u> formed over low density new snow which made it unstable. While not large, these slides will easily push you down and can be harmful if they push you into hazardous obstacles or terrain traps. - GNFAC
