Bridger Bowl

Date Mon, 11/18/2024 - 16:10 Activity Skiing

Dug a snow pit on a northern aspect at Bridger Bowl around 7800ft of elevation. Snow depth ranged from 45-50cm. Had a very reactive CT 2 on the most recent snow layer around 25cm deep in the snow measured from the ground up. Attempted a hasty ECT before we lost sunlight but did not get propagation. There was visible wind loading on upper elevations as well.

Region Bridger Range Location (from list) Bridger Bowl Observer Name Simon MacLean
