large natural avalanche, NE Mt. Henderson

Henderson Mountain Cooke City 12/30/2024 Code HS-N-R4-D2-O Elevation 10090 Aspect NE Latitude 45.05240 Longitude -109.94500 Notes

From obs "We were ski touring on the SW side of Mt. Henderson today, and noticed a large (natural?) avalanche on the NE <u>aspect</u> of Henderson. First observed at around 1:15pm. It appeared to be very fresh, possibly from a <u>remote trigger</u> this morning.

2 photos attached. A NE aspect, around 10,000'.

It looked to be 4-6' deep and about 500' wide. And it failed on snow at/ near the ground."

From obs: "We popped over to the recent avalanche on the east side and got a crown profile. Avalanche is NE facing, 10090. HS-N-D2-R4-O

Crown is 105 cm deep, breaking on surface hoar. Details are in attached profile

Something noteworthy.. the slope angle at the crown is 30.1 degrees."
